

O2 AND O2X COURSE TENSIONING PROCESS

O2's and O2x large knurled rings (A) are “course tensioner.” These tensioners can be set tighter for heavier loads or be tightened if the ball swivels loses tension over time. To increase tension, loosen the main “T” knob and the small hex set screw (A), then turn the large knob clockwise while moving the arm. You can feel the tension increase. When you are set, re-tighten the small hex screw. Repeat the process on the second arm for continuity.
